

Arab American University

ASAL Technologies

**Summer training
for students at
Arab American University
in
Asal Technologies**

Task Description:

Imagine you are part of Microsoft. Find a product you love from Microsoft and brainstorm ways to improve it.

Supervised by Khader Sawaftah

Done by kali team.

Business Goals:

We have suggested these adds to PowerPoint to keep the interest of end user to use the application. Allows PowerPoint application to continue compete in the market, create distinction for the application, and facilitate the use of the application so PowerPoint does not lose to competitors. The last goal is targeting users who suffer from disables and making them more capable to use PowerPoint.

User Stories:

Title: smart show	Priority: high	Estimate: 13 story points
User story: As a presenter, I want to navigate from one slide to another using sound so that I can teach while I am away from the laptop. PowerPoint must understand the context of my talk and go to the specific slide.		
Description: In smart show, the presenter needs a hands-free method to control presentation. This can be achieved by implementing a voice recognition feature in PowerPoint. This system should be able to understand specific voice commands to navigate forward, backward, or jump to a specific slide based on some keywords or sentences mentioned by the presenter.		
acceptance criteria: • The application should be able to navigate to the next slide by order of presenter using sounds. • The application should be able to navigate to the previous slide by order of presenter using sounds. • The application should be able to navigate to any slide by dedication main key word in slide by order of presenter using sounds.		
Scenario: As a presenter I want to navigate from one slide to another using sound so that I can teach while I am away from the laptop, PowerPoint must understand the context of my talk and go to the specific slide. In this user story, when we discussed how much story points we need, we were divided into more than one opinion, the first wanted to put only 2 story points, the second opinion wanted to put 5 story points, and the last opinion wanted to put 13 story points so that:		

- The first opinion (2 story points): They wanted to navigate to the next or previous slide only.
- The second opinion (5 story points): They wanted to navigate to the slide according to its number in addition to using the next and previous slide.
- The third opinion (13 story points): They wanted to navigate according to the title of the slide and according to the things in it and use the next and previous slide, the process is done using artificial intelligence and needs machine learning training so that the process is done correctly.

After discussing and expressing all opinions, it was agreed to adopt 13 story points.

Title: interactive PowerPoint	Priority: medium	Estimate: 9 story points
User story: As a presenter, I want PowerPoint to be able to interact with me in the presentation via my voice, highlighting and focusing on what I'm presenting.		
Description: Interactive PowerPoint story focuses on enhancing the interactivity between the presenter and the slides by enabling voice recognition to control highlighting and focusing on specific part of slide. This allows the presenter to draw attention to point without use a mouse or pointer. This feature improves attendees' concentration during the presentation.		
acceptance criteria: • The application should be able to highlight and keep tracking the topics during presentation using sounds. • The application should be able to focus on any Figure in slides during presentation using sounds.		
Scenario: As a presenter, I want PowerPoint to be able to interact with me in the presentation via my voice, highlighting and focusing on what I'm presenting. In this user story, when we discussed the number of stories points, we needed, we were divided into more than one opinion, the first was to give it 12 story points, while the second opinion was 9 story points so that: • First opinion (12 story points): They wanted to use artificial intelligence and train machine learning from scratch until it works properly. • Second opinion (9 story points): They also wanted to use artificial intelligence, but since machine learning was used and trained in the first user story, according to their opinion, the effort would be less. After discussing and expressing all opinions, it was agreed to adopt 9 story points.		

Title: active features	Priority: low	Estimate: 1 story point
User story: As a presenter, I want to active or deactivate the voice detection functionality by using a button.		
Description: In active features the presenter needs to be able to easily control the audio detection feature in PowerPoint. This function ensures that voice commands are only recognized when they are needed, allowing the presenter to avoid accidental activation during non-presentation or discussion times, or even if the presenter does not want to activate this feature for some reason.		
acceptance criteria: • The application should show a button to active or deactivate the voice detection functionality.		
Scenario: As a presenter, I want to activate or deactivate the audio detection function. • In this user story, all team agreed to give her only 1 story point.		

Title: supporting tool	Priority: medium	Estimate: 7 story point
User story: As a presentation creator, I want from PowerPoint to be able to do five functions in creating presentation stage using my voice.		
Description: The support tool includes enabling voice commands to help create presentations, making the process more efficient and accessible. The presenter must be able to perform various tasks through voice commands. There are multiple categories of tasks such as font size, font family, or even line centering.		
acceptance criteria: • The application should be able to duplicate slides by order of presentation creator using sounds. • The application should be able to change the background colour of specific slide by order of presentation creator using sounds. • The application should be able to change the font size and font family by order of presentation creator using sounds. • The application should be able to remove a specific slide from presentation using sounds. • The application should be able to change the slide order using sounds.		
Scenario: As a presentation creator, I want from PowerPoint to be able to implement five functions in PowerPoint using my voice. In this user story, when we discussed how many story points we need, we were divided into more than one opinion, the first was to give it 15 story points, the second opinion was to give it 10 story points, and the last opinion was to give it 7 story points so that: • The first opinion (15 story points): They wanted to do 15 functions using voice. • The second opinion (10 story points): They wanted to do 10 functions using voice. • The third opinion (7 story points): They wanted to do 5 functions using voice. After discussing and expressing all opinions, it was agreed to adopt 7 story points and adopt 5 functions to be done using voice.		

Definition Of Done (DOD):

Functional requirements:

- All acceptance criteria are implemented.
- The application can recognize and respond to voice commands to navigate between slides.
- The system can understand the context of the presenter's talk and navigate to specific slides based on keywords.

Code Quality:

- Code will review and approve by at least one other team member.
- Code will follow the team's coding standards and best practices.
- No critical issues will remain in the code.
- The software will match quality factors and nonfunctional requirements.

Testing:

- Unit tests cover all new functionality and each unit pass without issues.
- Integration tests validate that voice commands trigger slide navigation and each unit in the system communicate with each other's without any issues.
- User acceptance testing will be conducted, and feedback addressed.
- No major bugs or issues will remain unresolved.

Documentation:

- All functionalities will be documented in the project's documentation.

Approval:

- The Product Owner will review and accept the features.
- Stakeholders will be informed, and necessary approvals will be obtained.
